Description

This PC program has been developed through a research project carried out in spinning mill. With this PC-program it is possible to improve yarn quality and also increase production levels from card/comber to ring frames as well finding out the faulty processing stage from card/comber to ring frames .In addition to that it computes important fibre parameters,index of irregularity at each stage of processing . compute important fibre parameters,index of irregularity at each stage of processing,curves for short fibre content percentage,mean fibre length for leading and trailing hooks and drawing actual and optimum DRAFT CURVE through" Knowledge Based Problem Analyses and Problem Solving Techniques"developed by ITRU GROUP LTD.

This program makes use of the Itru Fibre Tester UAK-1 & evenness tester instruments to be more valuable to the spinning mills by determining short fibre content by fibre number, mean fibre length,index of irregularity and new conception of draft curve related yarn quality and spinning performance.

This PC-program for use to compute

A- Index of irregularity for each stage of processing

A- Mean fibre length by fibre weight curve for leading and trailing hooks from the Itru Fibre Tester UAK-1 span-length values to determine the fibre orientation degree and fibre breakage

A- Short fibre content curve for leading and trailing hooks to determine over-stretched fibres and unsuitable drafting conditions such as field of friction of drafting forces,ratch settings.

A- The complete actual draft curve in accordance with the actual fibre length growth and linear irregularity at each stage of processing so that optimum spectrogram curves could be obtained at each stage. We call this parameters as DRAFT CV and draft lengths for each process. Optimum linear irregularity value at each stage of processing to achieve optimum quality of yarn according to the requirements of yarn quality as well as identifying faulty running section in spinning process

Keywords

Draft curve, draft length ,draft angle ,spinning plan,spectrograph,drafting waves,span length,fibre properties,mean fibre length,fibre hooks,trailing hooks,leading hooks,spinning, fibre fineness ,yarn count,sliver count,drafting,ratch setting,knowledge based ,textile research.

The purpose of Spin Plan ver 2.0 Pc-Program and this research work could be summarized as follows

A-Analyzing the existing draft organization of ring spinning process and identifying the faulty running processing stages from card/comber to ring frames and improving yarn quality level

A-Revising a new drafting organization to increase production volumes from card to ring frames with the help of Spin Matrix ver 1.0 Pc-Program to optimize each stages of spinning process.

A-Identifying faults in drafting zones from card//comber to ring frames

A-Complete Analyses of drafting waves from card/comber to ring frames

A-Complete Analyses of fibre properties from card/comber to ring frames

Methods

2,5 and 50 % Span-length Fibre Length Measurement of Slivers to and fro (leading and trailing) , Evennes Tester and Counr Testers are necessary for slivers , rovings and yarn. Itru Fibre Length and Neps Tester could be useful (fully aotomated) fibre lengthj and Neps Tester or Itru Fibre Length Tester Software could be used with Canon Lid Scanners for measurements of sllivers. In this case you only need to purchase a canon lid scanner and our software. For further information please get in touch with us.

Fibre Length Measurement from Slivers (Itru Fibre Tester Software + Canon Lid Scanner)

Read more<<http://itru.net/ffis/fibretesterver21.pdf>>

1.1 Test Data Input Values

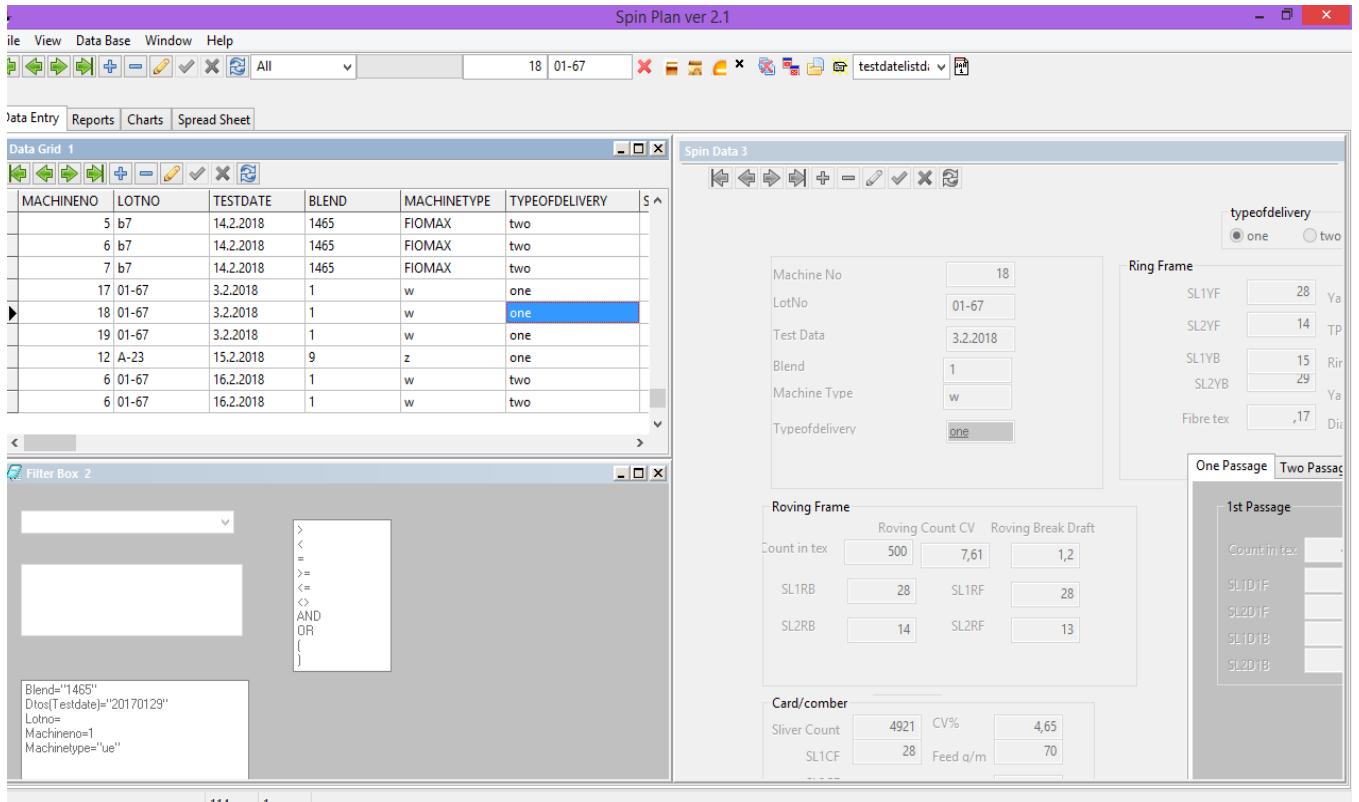

Test Data Input values consists of following parameters

Machine Data	Number	Lot No	Test Date	Machine Type
Fibre Properties	Fibre Graph 2,5 % Weighted Span Length in mm	Fibre Graph 50% Weighted Span Length in mm		
Sliver/Yarn Count	Tex			
Break Draft				
Number of Doublings				
CV % Evenness				

Test Data are in details shown below . Spin Plan Pc-Program are designed up to 4 passages after carding/combing.

1.2 Program Structure

1. Data Entry

Data Entry Page contains Data Grid (Data Base in Grid :All records) , Filter Box to Filter records and Spin Data (for one record) . You only enter the records once and + button copies the records data and you only change the changed parameters. Double click on these windows to maximize.

Windows : Cascade -Tile Vertically- Tile Horizontally opened windows. Data can be edited inserted on Data Grid and SpinDat windows . One can see the changes on another windows.

New-Adds a new record to the data base

Add-Adds a selected record to the data base.

Edit-Edits selected record in the data base.

Delete-Deletes selected record from the data base.

it would take a lot of time for entering all the records so Filter Box is used for copying records for the same date. For this purpose the copying records in Filter Box is used. With the help of Filter Box and Copying Record button the last day of Machine Card Index Data is completely copied to the new Data .So the operator only enters the end of Counter Readings of each shifts.

Press Apply Button which loads dates worked
Select the Last Date from Combobox

Press Filter Selected Date Tool bar button which is on the right of date string Button loads the selected date which is the last day of ring frame spinning geometry test.

Load DBF loads data base table Default table spinbge1.dbf

Save DBF saves data base table

Pack Table Purge Deleted : Removes the Deleted the deleted records from the database

Delete :Deletes the records on the grid. Therefore be careful

Empty : Clears the table

Apply : Filter the records according to database parameters.

Lotlist : Make lists for date,lot,machine type and date.

And all the records for that day are listed and when Copy Record button is pressed all the record is copied

With filter box you can filter records Apply button applies filtering command such Machine No=1 and Lotno='A-25' filters the records with Machine no=1 and Lotno=A-25

Insert (+) command copies the selected record. Use the same date of record when copying otherwise you will damage the date base. . If there is a holiday change the date time from computer so that correct date is entered. There are also many filtering logic are available i.e and ,or , >>, <= ,(,) <> etc. . One can use any combinations of these

Draft Index Analyses

	: LNCV :	Cut Length in m :	Index:	Req CV%
Ring	: 9,94 :	0,02 :	1,30:	9,94
Roving	: 4,78 :	0,58 :	2,41:	2,95
4th Drawframe	: 1,49 :	5,22 :	5,16:	1,30
3rd Drawframe	: 0,79 :	34,26 :	6,80:	0,65
2nd Drawframe	: 0,38 :	205,58 :	6,37:	0,33
1st Drawframe	: 0,18 :	1233,47 :	7,13:	0,17
Card/Comber	: 0,09 :	7400,82 :	10,58:	0,09

Itru Spin Plan computes the required CVL value (coefficient of variation between cut lengths) Off-Standard process could be identified by comparison of Req CVL with LNCVL in this case there is a problem in Roving Process. (2,95 and 4,78) . This can be also be seen LNCVL and LN Cut-Length Chart that should be a straight line. Problem analyses and problem solving algorithms described the solutions for the problems.

: Process	: Draft Slope :	Draft Angle
Ring-Roving	: 0,22 :	12,61
Roving-4th Passage	: 0,53 :	28,01
4th Passafe-3rd Passage	: 0,34 :	18,64
3rd- Passage-2nd Passage	: 0,40 :	21,87
2nd-Passage-1st Passage	: 0,42 :	22,71
1st Passage-Card/Comber	: 0,41 :	22,14
1st Passage-Card/Comber		
1st Passage-Card/Comber		

Draft angle shows the inclination of the process to quality. Yarn quality has been deteriorating at roving process. Greater the draft angle higher the short and long term variations and imperfections in the yarn.

Total Drafts

1st Passage-Card/Comber

Ring	:	26,27
Roving	:	9,00
Drawframe4	:	6,56
Drawframe3	:	6,00
Drawframe2	:	6,00
Drawframe1	:	6,00
Total	:	335116,63

This suggests that total draft in roving should be reduced.

3 Pc-program Outputs and How to use the pc-program

Spinning Plan (Draft Organization) has effects upon end break rate and yarn quality and production levels. Upto 20 % of increase in production and quality improvement can be achieved with proper Draft Organization (Spin Plan) and this pc-program helps you to achieve your targets.

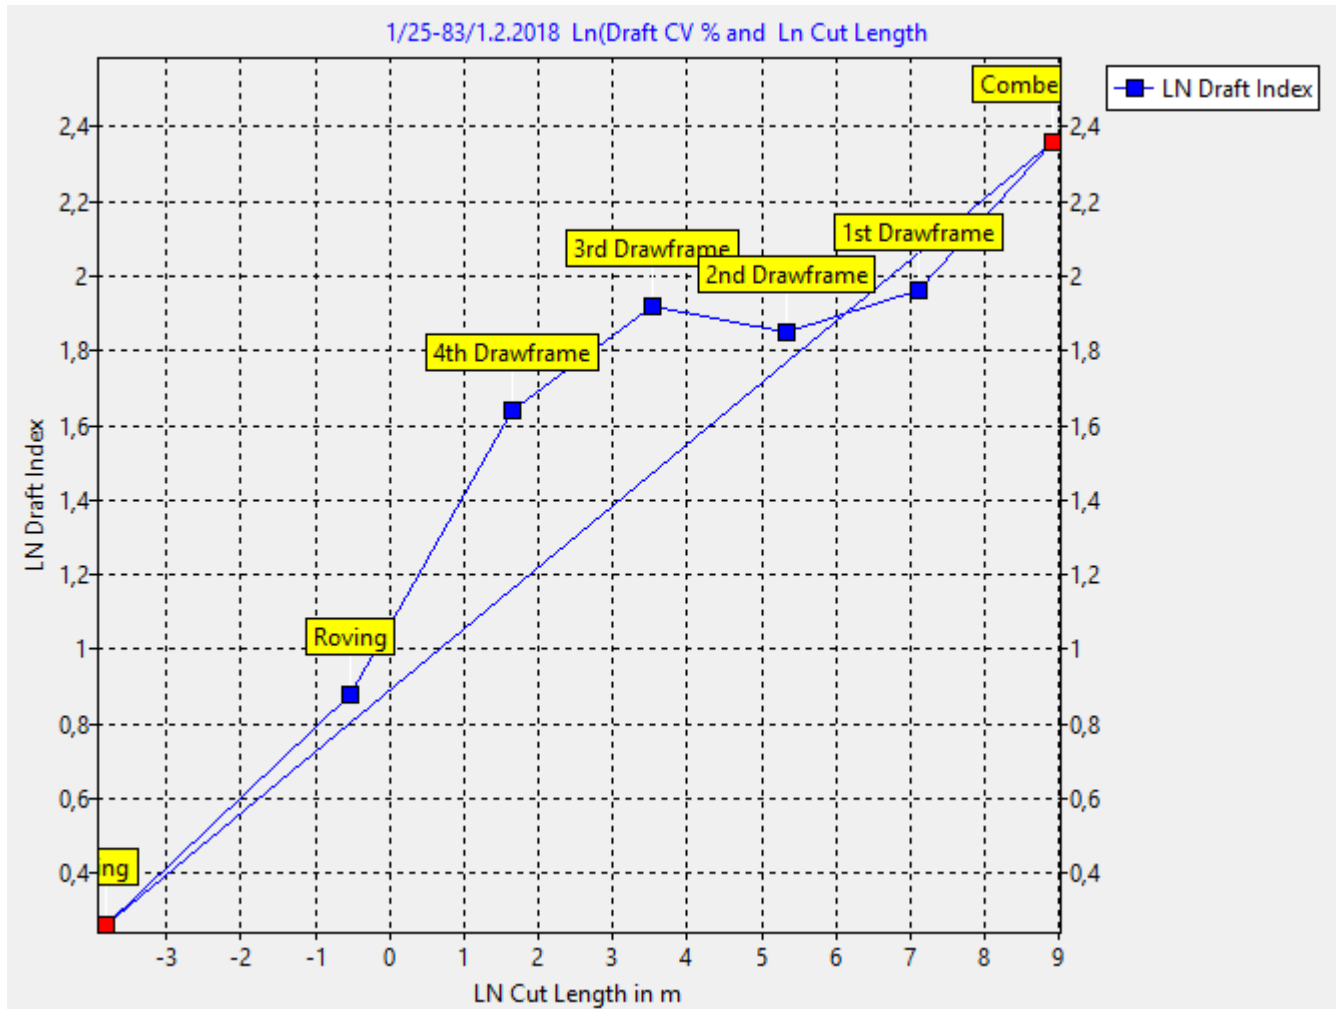

3.1 Charts

Fibre Mass Staple Diagrams of 4 passage carded Spinning Process -Special Process

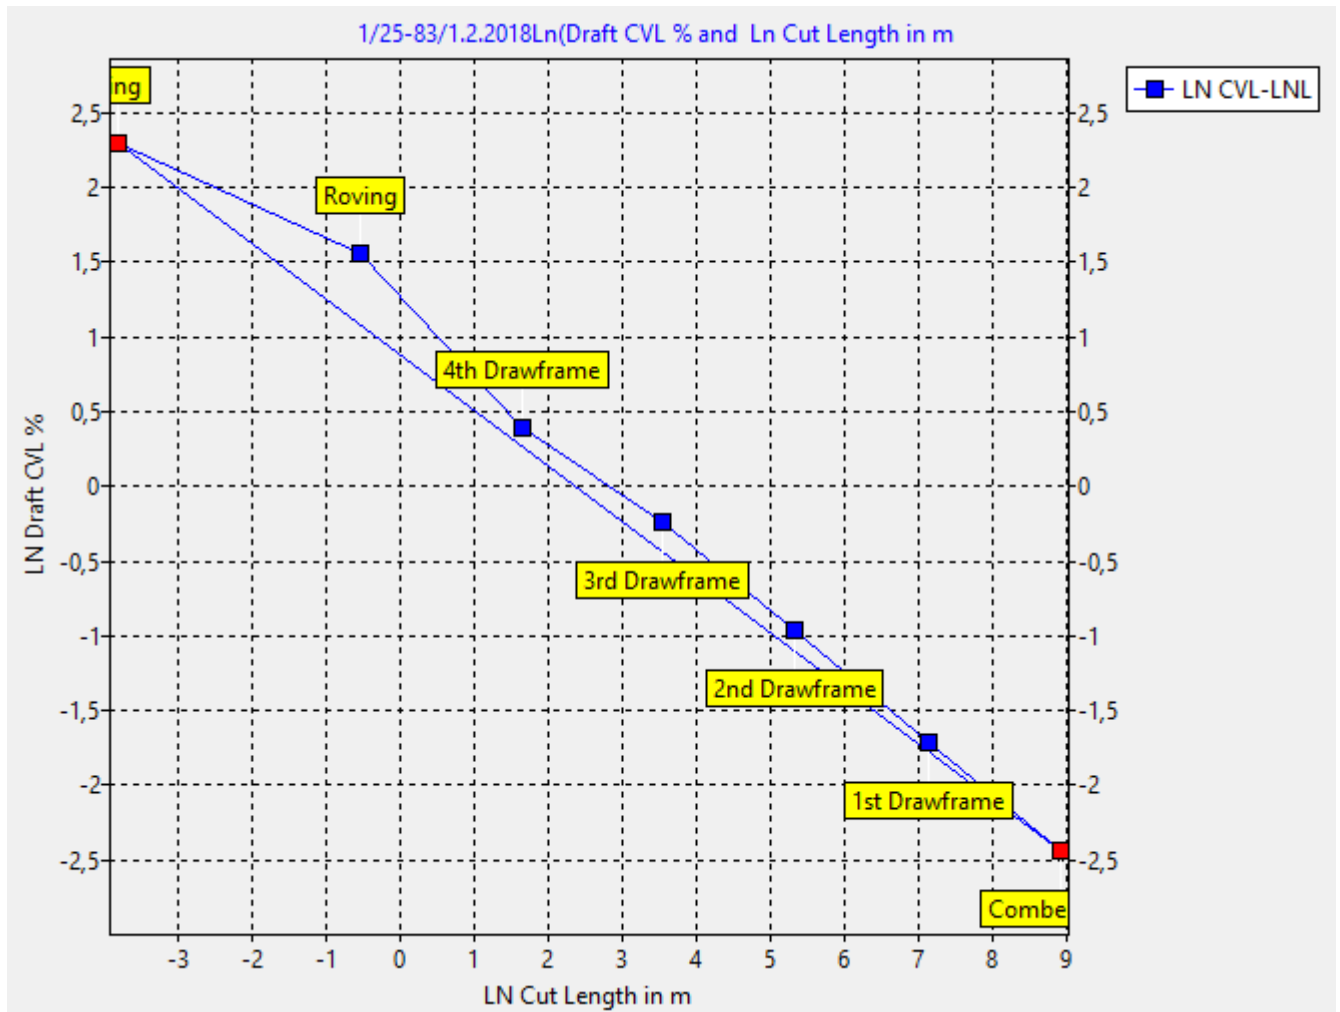

Roving Leading-4th Passage Leading comparison an increase in short fibre content.

Draft Index

Draft Index shows that 3rd and 4th passages should be improved in terms of actual CV values.

LN Variations Between Lengths and Cut Lengths for each process. (Draft CVL Cut Length)

LN CVL and LN Cut Length Chart shows that there is a deviation in the process at roving.

3.2 Technical Data Input for Spin Plan Pc-Program

4.1 The Procedure of Application in Mil

Spin Plan R&D project application is a rough adjustment of spinning mill and a starting point of Technical Data /Machine Settings R&D Project.

Therefore , to apply this project following table should be prepared .

<i>Lot no</i>	<i>Blend</i>	<i>% of Total Production</i>	<i>% of Mixes</i>	<i>Blend Fibre Tex</i>	<i>Spinning Index</i>

When the above Table is filled Spin Plan should be started from the highest production % of lots to lower ones respectively.

For each lot Technical Data Input Values should be gathered to enter the Pc-Program

This involves following Tests

- Fibre Length Tests from Card to Ring Frames front and back side of the sliver
- CV% Evenness Tests
- Count Tests at each stage of processing

4.2 Outputs of Spin Plan ver 1.0 Pc-Program

- a) Fibre Growth Analyses
- b) Drafts
- c) Draft Index Analyses
- d) Spectrograph Analyses
- i) Mechanical Faults
- ii) Drafting waves
- e) Performance Control
- f) Summary report
- g) Fibre Analyses chart
- i) Mean Fibre Length by number(Average of Leading and Trailing Hooks)
- ii) Short Fibre Content by Fibre Number
- iii) Coefficient of variation of fibre length distribution)
- h) Draft Analyses chart
- i) Draft Curve
- ii) Index Curve
- iii) Draft Slope
- iv) Draft Angle
- v) Total Draft

4.3 Fibre Analyses , Hooked Fibres

Fibres leaving the carding machine are not always straight and some hooks on them . There are many kinds of hooked fibres in spinning process. But mainly leading and trailing hooks. And these hooks change their directions according to the Processing Draft Organization .

Front end of the sliver coming out from the carding machine can be denoted as Leading (Front-F) and trailing (back side) of the as Back-B. And according to this fibres direction and hence hook direction can be summarized as below.

Process	Direction	Measurement for Spin Plan
Card	F	2,5 % SLY
Card can delivery	B	2,5 % SLY
1 st passage Draw Frame Delivery	B	2,5 % SLY
1 st Passage Draw Frame Can Delivery	F	2,5 % SLY
2 nd passage Draw Frame Delivery	F	2,5 % SLY
2 nd passage Draw Frame Can Delivery	B	2,5 % SLY
Roving Delivery	B	2,5 % SLY
Roving bobbin Delivery	F	2,5 % SLY
Ring Front Roller Delivery	F	2,5 % SLY

Changes of Hooks in Carded Ring Spinning System

Trailing Hooks are mainly produced by Carding Machine and fibres are always longer after 1st passage of drafting due to removing of hooks. So Fibre Transfer Ratio in carding has great influence on hooked fibre content .

4.4 Revising of Existing Spin Plan and Correcting Faulty Running Process

Main lots are analyzed by Spin Plan Pc-Program. In order to carry out fully functional work ,all the process summary data should be collected. The faults have been identified by Spin Plan Pc-Program could be better used in Process Summary Technical Data and for improvement purposes as well.

Process Summary Pc-Program also assist the R&D Project of Technical Data/Machine Settings Process Optimization Workings.

Process Defects could be summarized as

- a) Mechanical defects
- b) Drafting Waves in draft zones at each stage of processing

Mechanical defects are caused by the rotating parts of and settings of each machinery in the processing stage and could be analyzed by Spinning Mill Data Bank Pc-Programs from Carding to Ring /Rotor frames.

Drafting waves on the other hand caused mainly by uncontrolled movement of fibres in draft zones. This fault cause variation in the evenness of the final product and may cause cloudy appearance on the fabric. Length of drafting waves are usually longer than mechanical defects . Spin Plan Pc-Program identifies both of these defects and helps to improve yarn quality.

-Draft Curve identifies the faulty running processing stage

-Spectrograph analyses identifies the faulty running draft zone and mechanical defect.

-Summary report suggests the recommendation for process improvement

5.1 An Example of Evaluation of Main Lots by Draft- Draft Length Curve

Process defects of main lots have been analyzed by Spin Plan Pc-Program

To confirm the results 10 spectrograph for each lot have been obtained and then compared with Draft Curves.

Process Defect Analyses from Draft Curve :

lot no	Ne	Faulty Running Process	Defect Observation
A-/67	20 (30 tex)	Roving	Significant
A-/68	20 (30 tex)	2 nd Passage and Roving	Significant
A-73	20 (30 tex)	Roving	Significant
A-61	20 (30 tex)	Roving	Significant
A-60	20 (30 tex)	Roving	Significant
A-43	20 (30 tex)	Roving	Slight
A-81	20 (30 tex)	No defect	Non

Table : Faulty Running Processing stages identified by Spin Plan pc-program Draft Curve

Comparison of Spectrograph and Draft Curve Analyses

Wave Length from Spectrograph	Tex	From Spectrograph	Draft Curve
1-2 and 10-12 meter	30	Roving	Roving
1,5-3 and 14-22 meter	20	Roving	Roving

Determination CV % values of Each Stage of Processing from Draft Curve

CV% of each stage of processing could be found out by Actual Draft Curve and ideal Draft Curve. Too low and too high CV% values at each stage of processing may lead to unevenness of yarn due to following reasons :

-Low CV % in cards, draw frames may be due to too much fibre parallelism and fibre breakage and may lead to high unevenness in yarn

Too high CV% in slivers may be due to high content of short fibre and in correct setting of ratch setting

To optimize CV % Values for each stage of processing Draft CV- Draft Curve could be plotted and from this curve required CV values for each stage of processing could be obtained. So ratch setting distances could be adjusted according to these values.

6 Stages of Spin Plan Pc Program

6.1 Factors Effecting Production Level and Cost in Spin Plan Pc-Program

Factors effecting the production volumes from Card to Ring Frame could be summarized as

- a) Sliver count range gram per meter
- b) Number of doublings (time to feed can)
- c) Machine speed m/min
- d) Efficiency %

Spin Plan Tests are carried out to optimize above factors with the help of Spin Plan Pc-Program and Spin Matrix ver 1.0 Pc-Program .

Depending upon the type of raw material and mill balance Spinning Plan always should be re-tested after each lot changes. Draft Curve as will be outlined in later will give significant information about the processing count range limits.

6. 2 Determination of Effects of CV Machine , Draft CV of Roving ,Neps in Roving, Roving Draft , Ring Draft variables on Yarn Neps in Polyester/Cotton Blends by Spin Matrix pc- Program

Test Data File :

Test No	CV Machine	Draft CV Roving	Roving Neps/gram	Roving Draft	Ring Draft	Ring Neps
1	14.040	6.525	68.000	7.500	33.330	300.000
2	14.290	6.710	74.000	7.650	34.090	330.000
3	14.600	6.630	71.000	7.820	34.880	340.000
4	15.230	6.710	93.000	8.000	35.710	405.000
5	14.990	6.740	72.000	8.200	35.690	424.000
6	16.420	6.860	86.000	8.420	35.700	452.000

Variables

x1	CV machine
x2	Draft CV roving
x3	roving neps
x4	roving draft
x5	ring draft
y	ring neps

Function : $y = b1.x1 + b2.x2 + b3.x3 + b4.x4 + b5.x5$

Parameter- Projection

Parameter	Projected	Std.Dev	t Student	Prob(> t)
b1	- 74.32	29.72	-2.50	0.24
b2	-100.64	46.19	-2.18	0.27
b3	3.85	1.09	3.53	0.18
b4	415.84	85.23	4.88	0.13
b5	- 41.18	16.20	2.54	0.24

Correlation Y-(Neps) and x-variables

CV machine	y 0.9126
Draft CV roving	y 0.8809
Roving	y 0.6557
Roving	y 0.9818
Ring draft	y 0.9252

Correlation between x-variables

1->2	0.872
1->3	0.710
1->4	0.931
1->5	0.796
2->3	0.610
2->4	0.881
2->5	0.774
3->4	0.561
3->5	0.664
4->5	0.906

Average Values:

CV machine	14.93
Draft CV roving	6.70
roving neps	77.33
roving draft	7.93
ring draft	34.90

Variables	Averages	Constants	% Contribution of variables
CV machine	14,93	-74,32	16,28
Draft CV roving	6,7	-100,64	9,89
roving neps	77,33	3,85	4,37
roving draft	7,93	415,84	48,38
ring draft	34,9	-41,18	21,08
ring neps	375		

From The above summarized Table one can see that Roving Draft has most significant role in effecting neps in Ring Spun Yarn . Roving Draft CV value has also effect upon neps in Yarn . Therefore , it is clear that Processing Organization i.e. SPIN PLAN has enormous effect upon yarn quality and should be determined by extensive Test Plans aided by SPIN PLAN and SPIN MATRIX PC-Program.

7.6 Knowledge Based Problem Analyses /Problem Solving

----- Knowledge Based Problem Analyses /Problem Solving -----

Fibre Breakage in Roving-Leading

Check Roll settings front and back. It may be too wide and too close

Check Roll Pressures

Check drafting waves with spectrograph forward and reverse

Check drafting rollers bearings

Check aprons top and bottom

Check shore hardness of top rollers

Check diameter of top rollers

Carry out Draft Rollers Setting Test as instructed by Itru

Roving sliver may be too fine or too coarse!!

Fed sliver may be too fine or too coarse!!

Fibre friction may be too high check humidity and static electricity of fibres!!

Too much short fibre . Check with spectrograph!!

7.7 Draft CV- Draft Length Chart

Draft Curve : Draft CV% -Cut Length Chart deviation from straight line indicates the faulty process . In this case Roving process is deteriorating the yarn quality.

Fibre Staple Curve :It can be seen that In Roving Frame an increase CVN% is indication of fibre breakage

7.8 Fibre Length Mass Staple Curves for trailing and leading Hooks from 2,5 and 50% Span lengths

Fibre Growth Curve for trailing and leading Hooks should also be carried out with UAK-1 for 1% SL , Effective Length and SFN % since long fibre breakage could only be identified by 1% SL from Staple Diagram.

8 Process Improvement for Spin Plan

STEP 1- For existing Draft Organization

Draft Curve :

Correct the faulty running process as outlined from the Draft Curve

Fibre Curve :

Correct the fibre breakage . An increase in CVN% is a indication of fibre breakage.

Spectrograph of Yarn :

a) Mechanical Defect

Correct the main defects in the processing

b)Wave lengths of all drafting waves of all processing stages could be seen in yarn spectrograph and computed in the pc-program . Correct the faults in relation to computed values. Itru Fibre Tester UAK-1 plots Spectrograph curve for any stage of processing compare UAK-spectrograph with Evenness Tester and check the drafting waves.

Knowledge Based Problem Analyses /Problem Solving

Take necessary remedial action according to suggestions given in Process Control section of the Pc-Program.

STEP 2:

Change Technical Data Input at least 6 times and make yarn from these different drafting organization . Make a matrix table for the test results . Analyze the test results with Spin Matrix ver 1.0 Pc-Program and find out the optimum solution for new test.

Carry out above test as outlined at step 1

STEP 3

Carry out Technical Data/Machine Settings Test Plans to fine gauge the spinning process for further improvement in relation to SPINNING PERFORMANCE INDEX. In order to carry out Technical Data/Machine Settings you must SPINNING MILL DATA BANK SYSTEM should have been already in the mill.

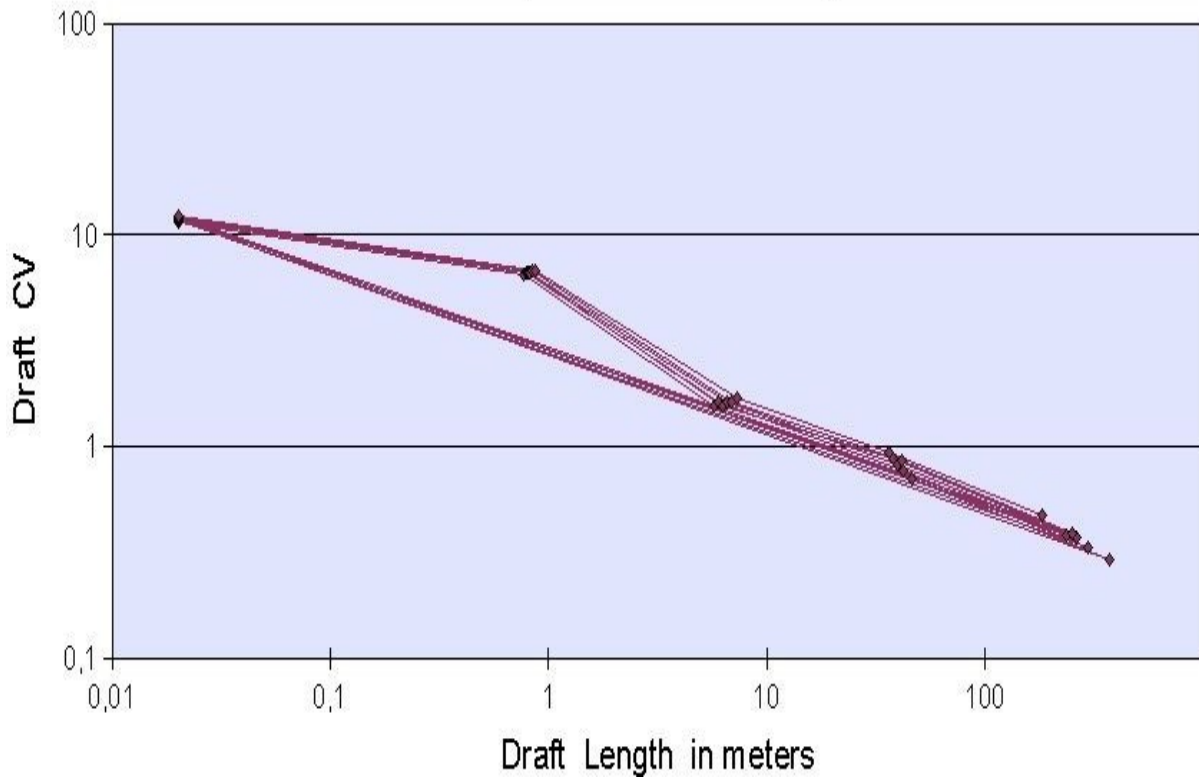

9 Spin Plan Test

Spin Plan Pc-Program could be used to optimize the draft organization with Spin Matrix ver 1.0 Pc-Program. For this at least 6 tests are required to optimize and improve the quality and increase the production from card to ring frames.

10 Technical Terms and Definitions

Terms	Definitions
Draft CV%	CV% of evenness computed according to draft length
Draft Length	Length of material corresponds to draft CV%
Lamda Maximum	Length of maximum amplitude of yarn from spectrograph
Draft Angle	Angle of Draft Curve
Draft Curve	Curve of Draft CV-Draft Length of each process
Index	Index of Irregularity computed from CV % of yarn and fibre mtex
Fibre Fineness	Fibre fineness in mtex measured from the ring frame front roller coming out
Drafting Waves	Faults in yarn caused by non-controlled fibres in draft zone of processing
Draft	Ratio of reduction in mass per unit length at each process
Break Draft	Draft at back zone of drafting system
Doublings	Number of cans for feed
Heads	Number of Laps for comber feeding
Sly1 Front	Leading end measurement of 2,5 % Span Length in mm
Sly2 Front	Leading end measurement of 50 % Span Length in mm
Sly1 Back	Fibres Trailing end measurement of 2,5 % Span Length in mm
Sly2 Front	Fibres Trailing end measurement of 50 % Span Length in mm
LM	Mean Fibre Length in mm by number or by weight
SFN	Short Fibre Content % by weight
CVN	Coefficient of Fibre Length Variation by number

If you need any terms should be added here please e-mail to itru@itru.net
